

NoSQL Project Analysis Assignment

1.) Please fill in your personal and contact details

Student Name	
Enrolment Number	
Section	
Subject Name	
Email Address	
Contact No:	

2.) Project Domain / Classification

Identify the technical domain and application area of your proposed project. (Explain in 20-40 Words)

3.) Project Title

Provide a clear, concise, and innovative title for your NoSQL-based project. The title should reflect the problem being solved and the proposed technology or application.

4.) Problem Statement

What specific real-world problem or limitation does your project aim to address? Explain the existing challenges and why the problem requires an efficient data management solution. (Explain in 50-70 Words)

5.) Proposed Solution

Describe your proposed project solution. Explain how the system will address the identified problem and how NoSQL technology will be used in the solution.

Students should clearly mention:

- Type of NoSQL database proposed
- Reason for selecting the database
- Type and nature of data to be stored
- Main users of the system

6.) Project Novelty / Innovation What is new, unique, or innovative about your proposed project compared to existing systems or applications? The project novelty may be based on: • A new application area • Innovative use of NoSQL databases • Improved data processing or storage • Real-time data handling • Scalability and distributed data management • Integration with AI, IoT, Cloud, Blockchain, or Analytics • Improved performance, security, or user experience
7.) Identify existing applications, research work, or systems related to your proposed project. Briefly explain their limitations and how your proposed system differs from them.
8.) NoSQL Database Selection and Justification Which NoSQL database will be used in your project and why? Type of NoSQL Database: Document / Key-Value / Column-Family / Graph Justification for Selection: Explain why this database is suitable for the proposed project.
9.) Database Design and Data Model Describe the proposed data model and major collections, documents, nodes, relationships, or key-value structures. Students should provide: • Main entities/data collections • Important attributes • Relationships between data • Sample document or schema structure
10.) System Modules and Functionalities List the major modules or features of the proposed system.

11.) Technical Advantages / Expected Outcomes What benefits will the proposed NoSQL-based system provide compared to traditional database or existing solutions?
12.) Limitations and Challenges What possible limitations, technical challenges, or constraints may arise during the development and implementation of the project?
13.) Technology Stack Mention the technologies, tools, programming languages, frameworks, and database systems proposed for the project.
14.) Current Stage of Project Development
15.) System Architecture and Workflow Students should provide: 1. System Architecture Diagram 2. Database/Data Model Diagram 3. Project Workflow / Flowchart
16.) Algorithm / Pseudocode Provide the main algorithm, pseudocode, or workflow used in the proposed system.
